Michelle Sawka

# Webinar

1. Asset Management & Natural Assets Introduction
2. Valuation Overview
3. Walk through the Guide
4. Street Tree Valuation
5. Forest Valuation
6. Key Takeaways & Looking Forwards
7. Questions

# Green Infrastructure and Natural Assets

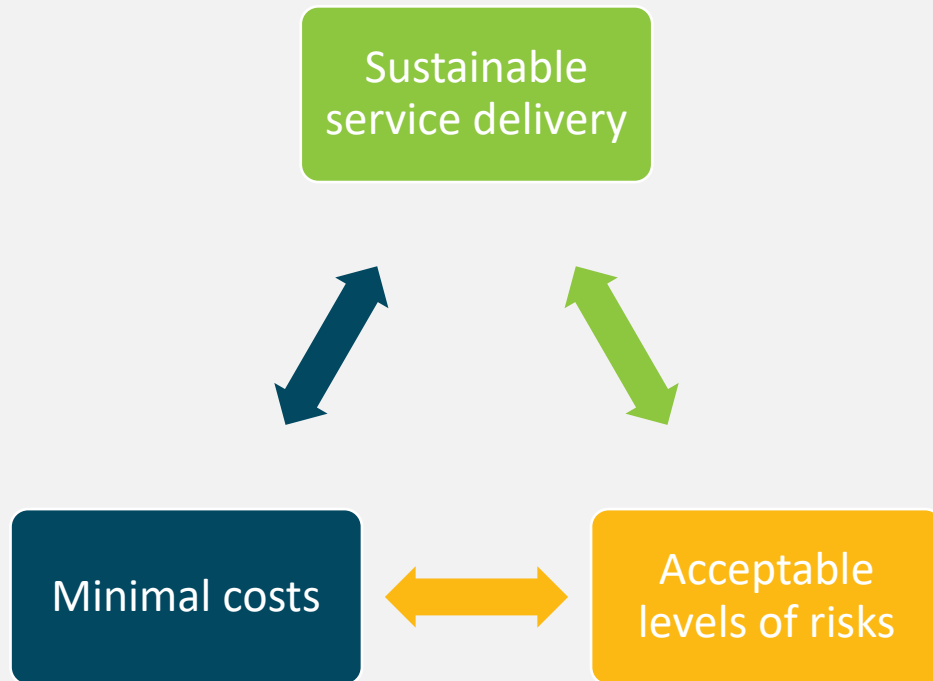

# Valuation Guide

- Practitioner focused
- Outlines multiple methods, makes recommendations
- Step by step calculations

# Asset Management Planning

A process that aims to balance:

# Asset Management Planning

Continuous Updates and Improvements

## 1. State of Infrastructure

Inventory and Hierarchy  
Condition  
Valuation  
Age and Useful Life  
Risk and Criticality

## 2. Levels of Service

Customer Levels of Service  
Technical Levels of Service

## 3. Lifecycle Management

Lifecycle Activities  
Lifecycle Costing

## 4. Financial Strategy

Available Funding Sources  
Funding Scenarios  
Projected Funding

# Purpose of Asset Value

Pipes

- 500 m
- Length
- \$550 K

Street Trees

- 350 trees
- Units
- \$875 K

Forests

- 5 ha
- Area
- \$791 K

- **Apples-to-apples comparison measure across all green (natural) and grey (traditional) assets**
- Common unit of dollars, \$

# York Region Corporate AMP

Service Group	Service Area	Current Replacement Value (\$M)
Community & Health Services	Housing Services	\$821.3
	Paramedic Services	\$20.8
	Seniors Services	\$5.6
Corporate Management	Information Technology	\$46.8
	Property Services	\$439.4
Environmental Services	Energy Management	\$1.6
	Forestry	\$488.3
	Waste Management	\$153.0
	Wastewater   CORE ASSET	\$4,026.9
	Water   CORE ASSET	\$1,941.1
Transportation Services	Roads   CORE ASSET	\$3,552.2
	Transit	\$557.3
York Regional Police	Police Services	\$249.3
Total		\$12,303.6

Forestry assets reported along side all other corporate assets

# Current Replacement Value (CRV)

Determines an asset's value based on the total cost to replace it today. This includes:

1. Using modern and cost-effective methods and materials
2. Meeting the required level(s) of service
3. Incorporating any updated standards or regulatory requirements

# Asset Value vs Lifecycle Costing

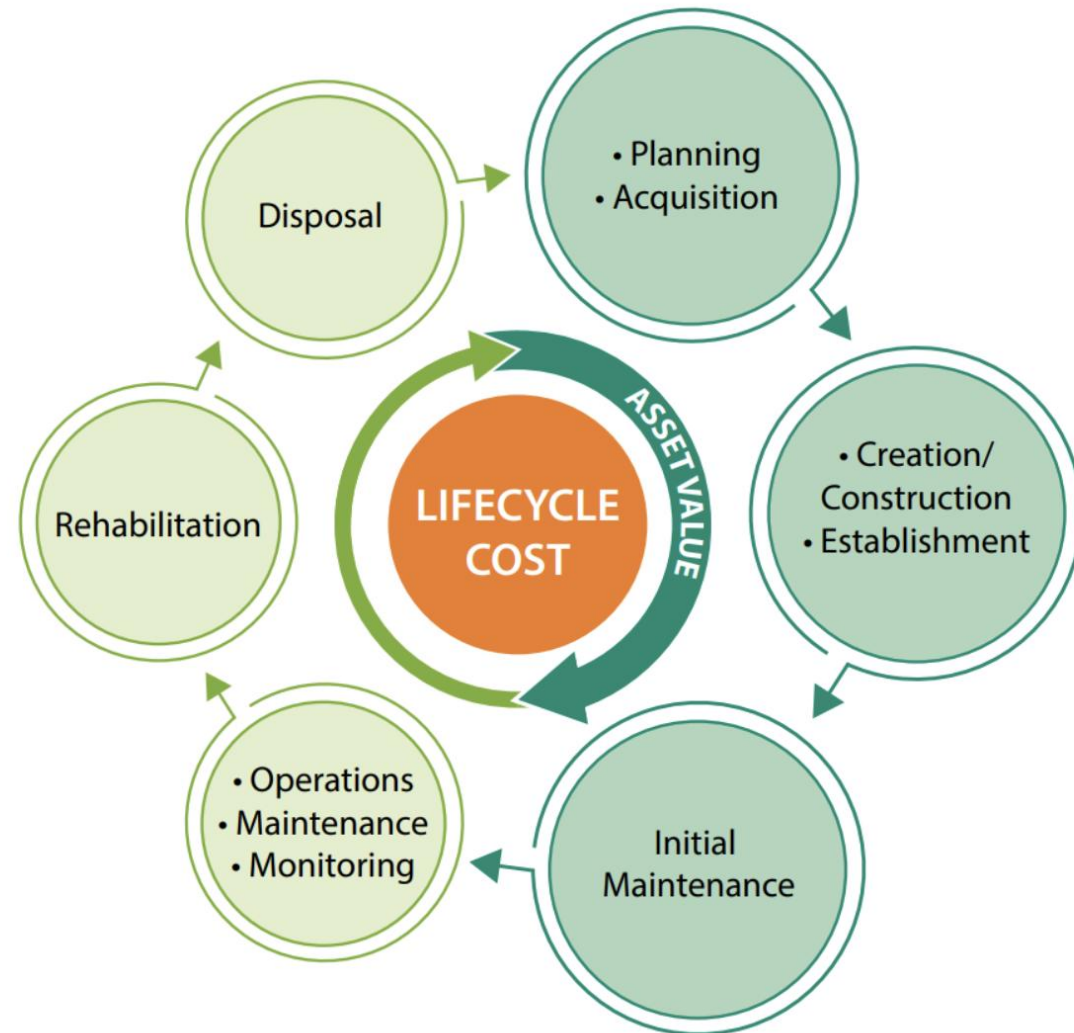

TABLE 14. COSTS AND PHASES ASSOCIATED WITH THE LIFECYCLE OF A FOREST ASSET

Lifecycle Phase	Current Replacement Value	Lifecycle Cost	Description
<b>Plan and Acquire</b>	\$50,000	\$50,000	Studies, project management, public engagement, planning, land acquisition ( <i>if recent</i> )
<b>Create and Establish</b> <i>(from Table 11)</i>	\$169,000	\$169,000	Site preparation, tree planting, habitat installation, and 5 years of monitoring and maintenance ( <i>e.g., watering, invasive species control</i> )
<b>Operate and Maintain</b>	-	\$2,000,000 (\$40,000/year x 50 yrs)	Invasive species control, pruning, thinning, hazard tree removal
<b>Monitor</b>	-	\$500,000 (\$10,000/year x 50 yrs)	Forest health monitoring, ecological assessments
<b>Rehabilitate or Dispose</b>	-	\$0 (not applicable or minimal)	Not typically disposed, ideally shifts to natural succession
<b>TOTAL</b>	\$219,000	\$2,719,000	-
<b>Multiplier</b>	20 m <sup>2</sup> /ha ÷ 5 m <sup>2</sup> /ha = 4	-	A basal area of 20m <sup>2</sup> /ha; lifecycle costs are not adjusted for age, they are based on actual costs
<b>TOTAL</b> <i>(Adjusted for natural asset age)</i>	<b>\$876,000</b>	<b>\$2,719,000</b>	-

# Other Valuation Methods

Biodiversity Offsetting

Land Value

Ecosystem Service Valuation

# Biodiversity Offsetting

- Often use similar theory
- TRCA's Guideline informed methods in the Guide
- Does not exist in many municipalities

Ecological Offsetting Fee Table Example Calculation with Tree Removal Permit			
Item	Replacement Rate*	Total Area or Quantity**	Total (\$)
Woodlot Tree Removal Compensation Fee	\$57,500 / ha	2.7 ha	\$155,250
Individual Tree Compensation Fee	\$500 / tree	3	\$1,500.00
<b>Total Offsetting Fee Payment</b>			<b>\$156,750</b>
Ecological Offsetting Fee Table Example Calculation Without a Tree Removal Permit			
Item	Replacement Rate*	Total Area or Quantity**	Total (\$)
Woodlot Tree Removal Compensation Fee – No Permit	\$140,500 / ha	2.7 ha	\$379,350
Individual Tree Compensation Fee – No Permit	\$1,220 / tree	3	\$3,660.00
<b>Total Offsetting Fee Payment</b>			<b>\$383,010</b>
* Rate from the Fees By-law at the time of policy approval, to be amended annually.			
** Example of development removal of 2.7 ha of woodland plus 3 individual trees			

# Land Value

- Not included in traditional asset CRV
- Market value is volatile
- Zoning impacts

# Ecosystem Service Valuation

## Ecosystem services valuation

- Economic Valuation
- Useful for making a business case for protecting and managing green infrastructure
- Does not align with the valuation method used for traditional assets

## Asset value for asset management planning

- Current replacement value
- Asset focused
- Consistent across all assets in an asset management plan

# Ecosystem Services

Types of services:

- Stormwater Management /flood mitigation

- Avoided healthcare costs

- Property Value Increases

- Recreational use

- Carbon Storage and Sequestration

- Air Quality Improvements

# Street and Park Trees

- Individual trees, inventoried and managed as such
- Planted or naturally seeded
- Typically along road rights-of way, road allowances, or in parks
- Urban and rural

# Asset Value Guiding Principles

Set up the inventory to support valuation

Be efficient

Value calculation method needs to be feasible, replicable, and establish a process for regular updates

Don't make it too complex

Alignment with Corporate Asset Management approach

Apples-to-apples comparison

New or better information can emerge, this can impact value estimates

Continuous improvement

# Value Calculations

**Current Replacement Value = Tree Unit Cost x Number of Trees**

Unit Cost (\$ per tree) = Average Tree Price + Installation Cost + Establishment Cost (3 years)

- **Tree price:** the average nursery cost for the plant (a caliper-sized tree)
- **Installation cost:** includes the planting labour, transportation, any basic design fees, and/or shipping expenses of a tree
- **Establishment costs:** include the costs for tree establishment, including initial mulching and watering (for a 2-year warranty period), and mulching and watering for at least one additional year
- Typically NO tree or stump removal costs

# Unit Cost Sources

- Internal tender or contract documents
  - Or similar from neighbouring municipality or conservation authority
- Local tree nursery costs for caliper-sized trees
- International Society of Arboriculture Ontario's (ISA) "Ontario Supplement" cost table

TABLE 4. AVERAGE TREE PRICES FOR TEN COMMON TREE SPECIES IN SOUTHERN ONTARIO<sup>4</sup>  
(Sourced from ISA cost table, inflated from 2021 to 2025 CAD using a rate of 15.88%)

Botanical Name	Common Name	Number of Nurseries with Prices	Rounded Average Caliper (mm)	Average Tree Price (inflated to 2025 costs)
<i>Acer x freemanii</i>	Freeman maple	2	90	\$429
<i>Celtis occidentalis</i>	Hackberry	5	80	\$370

**Remember to inflate all costs to current year**

# Accounting for Age

- Current replacement value assumes the replacement is delivering the same services (**like-for-like replacement**)
- Built assets may provide services immediately after construction, but **natural assets take time to establish**
  - For example, the services provided by a 50-year-old tree cannot be matched by replacing it with a young, small tree.
- Recommended approach is to account for the age or size of the asset by **using a multiplier to increase the replacement cost of mature assets** (e.g., estimating the cost of replacing a single mature tree with multiple small trees)

# Multipliers – Diameter or Basal Area

Current Replacement Value = Tree Unit Cost x Number of Trees\*

\*Quantity of Replacement Trees – based on tree diameter or basal area

Trunk Diameter Replacement Tree

Basal Area Replacement Tree

# Size-based Street and Park Tree Valuation Methods

- **CTLA Trunk Formula**
- Trunk Diameter
- Trunk Basal Area

Description	Data Required	Advantages
Assumes one tree is 'replaced' by several trees which together have the same basal area but then depreciates the value of the tree based on its location, functionality, and condition	<ul style="list-style-type: none"><li>• Tree diameter at breast height (DBH)</li><li>• Unit cost per tree</li><li>• Condition</li><li>• Functional limitations</li><li>• External limitations</li></ul>	<ul style="list-style-type: none"><li>• Accounts for the exponentially larger service level of bigger trees</li><li>• An internationally recognized tree replacement cost valuation method</li></ul>
		Disadvantages
		<ul style="list-style-type: none"><li>• Manual is proprietary and purchasing the manual has an associated cost</li><li>• Data intensive</li><li>• Complicated to calculate, high risk of miscalculation errors</li><li>• Very specific to each tree, whereas asset management valuation attempts to use general/average costs</li><li>• Depreciation not included for other traditional assets</li><li>• Considers tree condition, which is not included in valuation of traditional assets</li></ul>

# Size-based Street and Park Tree Valuation Methods

- CTLA Trunk Formula
- **Trunk Diameter**
- **Trunk Basal Area**

Description	Data Required	Advantages
Assumes one tree is 'replaced' by several caliper-sized trees which together have the same trunk diameter as the tree being assessed	<ul style="list-style-type: none"> <li>• Tree diameter at breast height (DBH)</li> <li>• Unit cost per caliper tree</li> </ul>	<ul style="list-style-type: none"> <li>• Simple to calculate</li> <li>• Accounts for increased services of larger trees</li> </ul> <p><b>Disadvantages</b></p> <ul style="list-style-type: none"> <li>• Underestimates the true size and results in a lower value per tree in comparison to the Trunk Basal Area and CTLA Trunk Formula methods</li> </ul>
Assumes one tree is 'replaced' by several caliper-sized trees which together have the same basal area as the tree being assessed	<ul style="list-style-type: none"> <li>• Tree diameter at breast height (DBH)</li> <li>• Unit cost per caliper tree</li> </ul>	<p><b>Advantages</b></p> <ul style="list-style-type: none"> <li>• Fairly simple to calculate, involves a basic equation</li> <li>• Accounts for the exponentially larger service level of bigger trees</li> </ul> <p><b>Disadvantages</b></p> <ul style="list-style-type: none"> <li>• Can result in very high valuation for large trees</li> </ul>

# Street and Park Tree Valuation Method Comparison

TABLE 6. METHOD COMPARISON BY TREE SIZE

METHOD	VALUATION			
Tree DBH*	5 cm	10 cm	30 cm	50 cm
Trunk Diameter	\$1,000	\$2,000	\$6,000	\$10,000
Trunk Basal Area	\$1,000	\$4,000	\$36,000	\$100,000

# Recommendations

	Trunk Basal Area	Trunk Diameter	CTLA Trunk Formula	One-to-One
Efficient	✓	✓		✓
Not too complex	✓	✓		✓
Apples-to-apples with grey infrastructure	✓	✓		✓
Accounts for <b>exponentially</b> higher services of large trees	✓	✓	✓	
Area for continuous improvement		✓	✓	✓

# Valuation Approaches for Forests

# What are Forests?

- **A treed community:** tree canopy cover  $> 25\%$  in terrestrial or wetland ecosystems, e.g., savannahs or treed swamps
- **Woodland:** A terrestrial tree community with canopy cover  $> 35\%$  and  $\leq 60\%$
- **Forest:** A terrestrial tree community with canopy cover is  $> 60\%$

# Forest Valuation

Current Replacement Value =  
**Afforestation/Restoration Cost per Ha** x Area of the  
Forest Asset

## Restoration vs. Afforestation

# Options for Forest Valuation

- **Option 1:** Afforestation Cost Method

**Current Replacement Value = Afforestation Cost  
per Ha x Asset Area**

- **Option 2:** Afforestation Cost Method with  
Multiplier to Account for Age

**Current Replacement Value = Afforestation Cost  
per Ha x Asset Area x Multiplier**

# Forest Valuation Methods: Overview and Data Requirements

Method	Description	Data Required
<b>Afforestation Cost Method</b>	A per unit area afforestation cost rate is estimated and applied to the area of the asset to obtain a total replacement value	<ul style="list-style-type: none"><li>• Forest area (hectares)</li><li>• Afforestation cost rate</li></ul>
<b>Afforestation Cost with Basal Area Multiplier</b>	The <b>Afforestation</b> Cost Method is used to calculate a base replacement cost. This value is appreciated by applying a multiplier which takes into account the stand basal area of the asset, where basal area is used as an indicator of the structure and function of the forest	<ul style="list-style-type: none"><li>• Forest area (hectares)</li><li>• Afforestation cost rate</li><li>• Stand basal area</li></ul>

# Forest Valuation Methods: Pros and Cons

Method	Advantages	Disadvantages
<b>Afforestation Cost Method</b>	<ul style="list-style-type: none"><li>• A standard approach applicable to all asset types</li><li>• Simple to calculate</li><li>• The replacement cost represents the cost of creating an asset of the same size</li></ul>	<ul style="list-style-type: none"><li>• Does not account for age</li></ul>
<b>Afforestation Cost with Basal Area Multiplier</b>	<ul style="list-style-type: none"><li>• Partially accounts for forest age</li><li>• Benchmark afforestation cost rate and base replacement cost can still be used for lifecycle costing as needed</li><li>• Stand basal area can be assessed objectively, quickly and cost-effectively using a wedge prism, widely used by foresters</li></ul>	<ul style="list-style-type: none"><li>• More steps to apply, more data to collect</li><li>• Basal area is an imperfect indicator of forest structure and function</li><li>• The quality of the species comprising the basal area are not directly accounted for</li><li>• Thinning can result in a sudden drop in basal area and therefore value</li></ul>

# Choosing Afforestation Approach

## Traditional

- Using a tractor to machine-plant coniferous species over a large area.
- Does not aim to create a natural forest in the short term, but rather to establish forest conditions (shade, soil health, and wind protection)
- Pros: inexpensive, quick to start, and does not require as much site preparation or after care
- Cons: takes longer to start providing the same levels of service as a mature natural forest; can be more susceptible to disease and pests.

vs.

## Enhanced

- Planting a greater diversity of species by hand, in varying densities and patterns, and adding habitat features.
- Pros: produce naturalized forests that provide variety of services faster; more resilient to disease and pests; long-term savings on maintenance and management costs.
- Cons: expensive

# Identifying Activities

Activities/Costs	Traditional Afforestation
<b>Project Management</b>	Project initiation, planning, execution, control, and closing
<b>Planning and Design</b>	Site assessment, species selection, development of a planting plan
<b>Site Preparation</b>	Soil preparation, site grading and hydrological restoration, and removal of vegetation as needed
<b>Planting</b>	Seedlings
<b>Monitoring</b>	<ul style="list-style-type: none"><li>• Monitoring of vegetation for at least 3 - 5 years</li><li>• Optional fauna monitoring</li></ul>
<b>Establishment Activities</b>	<ul style="list-style-type: none"><li>• Including follow-up infill planting, and competition control</li></ul>

# Calculating Afforestation Unit Cost Rate

Activities	Traditional Coniferous Afforestation (1 ha)	Enhanced Afforestation Planting (1 ha)
Project Management	\$5,000	\$5,000
Site Preparation	\$2,000	\$17,000
Deer Fence	\$0	\$38,000
Planting	\$10,000	\$65,000
Plant Replacement	\$2,500	\$18,000
Habitat Installation	\$0	\$26,000
Monitoring/Site Assessment	\$5,000	\$5,000
<b>TOTAL</b>	<b>\$24,500</b>	<b>\$174,000</b>

# Forest Basal Area Multiplier

Mature forests assumed to have larger basal area than younger forests

$$BA = \pi \times (DBH/2)^2$$

**Current Replacement Value =**  
Afforestation/Restoration Cost per Ha x Asset Area  
x Multiplier

# Calculating Forest Basal Area Multiplier

Average basal area (m <sup>2</sup> /ha)	Basal area of 10-year-old restoration site (m <sup>2</sup> /ha)	Multiplier
10	5	<b>2</b>
12	5	<b>2.4</b>
15	5	<b>3</b>
18	5	<b>3.6</b>
50	5	<b>10</b>
55	5	<b>11</b>

- 10 years after planting, a stand basal area of 5 m<sup>2</sup>/ha is expected

- Multiplier =

$$\frac{\text{Stand basal area}}{5 \text{ m}^2/\text{ha}}$$

# Key Takeaways

- If possible, consider valuation approach before collecting inventory data to capture inputs necessary for valuation (e.g., DBH, forest basal area)
- Apply straightforward valuation approach that reflects size/age
  - Accounting for age can be an area for improvement if data are not currently available
- Valuation for natural assets should be aligned in approach with grey/traditional infrastructure to ensure consistency

# Opportunities for Advancement

- Develop Standardized Guidelines
- Create Detailed Valuation Guidance on Other Natural Asset Types
- Collaborate on an Approach for Invaluable Assets
- Develop Tools
- Conduct Training
